

Product Description

The Phone Validation product provides application components that can retrieve and display phone validation data for Salesforce Lightning and Classic applications. This product is used in conjunction with APIs provided by realphonevalidation.com.

Product Features

Phone Validation provides point and click no-code configuration to minimize setup and maintenance costs. Application users can view and update phone validation data retrieved on demand from the realphonevalidation.com APIs. Schedulable periodic batch updates are also provided.

Product Benefits

Provides your Salesforce users with up-to-date telco data to avoid calling disconnected phones, identifying land line vs. cell, and flagging phones that are on do not call lists. All Lightning Platform security features are automatically supported. This product allows Salesforce users to view up-to-date telco data without the need for costly, time-consuming custom development.
